

Hands-on approach to your own biochar!

- Drum can version

1 Fill the dry carbon material inside a tall can. Cover the carbon material with long branches.

2 Make sure that when the can is turned up-side-down in the drum, the carbon material does not spill out.

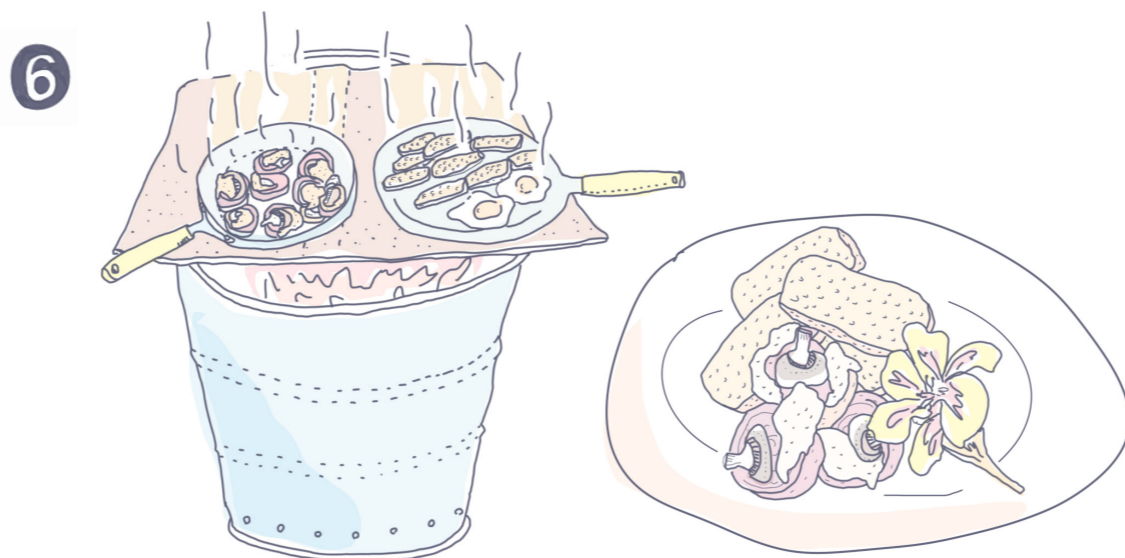

3 Fill it completely with firewood.

4 Start the fire from the top.

5 The carbonizing process has started in the can!

6 My favourite meal is sliced tempeh with beets, sliced mushrooms and melted cheese.

7 Wait until the can has cooled down. Harvest the biochar!
